INTRODUCTION

This report contains the tabular and graphic data for reported vital events which occurred in the years 1968 and 1969.

The data are presented together in order to facilitate comparisons between the two years.

The interested user will notice several changes in this year's report. The State of Washington centralized marriage and divorce records on January 1, 1968 thus joining 44 other states which maintain centralized marriage records and 41 states which have centralized their divorce records. As a result of this centralization of records we are, for the first time, able to present more accurate and detailed tables of marriages and divorces occurring in this state.

In addition, data are now presented by counties within the 13 standard districts proposed by the Office of State Planning and Community Affairs and established by Executive Order on August 6, 1969. Cities over 10,000 population are also reported in their respective counties.

Although most of the tabulations correspond with those in earlier reports, some have been regrouped and are presented in a slightly different manner. The hope here is to provide better access to the information they contain.

General Population Survey

Washington is still being carried along on the face of a population wave. Not a local phenomenon, the West coast of the United States has constantly felt the surge of a population influx that began before 1950. Although the flow has not ebbed, it has not been constant, as Table 1 shows for Washington State.

In 1969, according to population estimates provided by the Population and Research Section of the Washington State Program Planning and Fiscal Management Office, Washington increased by 36,000 people. As shown in Table 2, this has been the smallest percentage increase since 1963. The activity between 1965 and 1968 may be associated with an expansion of industry around the Puget Sound area during those years. The economic situation deteriorated somewhat in 1969 and was reflected in this statistic, which also declined.

The increase has not been uniform across the State. The migration of younger people toward urban areas has been the trend of the past and reflects our national experience. However, as Table 3 indicates, the Puget Sound area, in particular, has felt the brunt of expansion; rural counties have increased little, or have decreased.

Examination of the age distributions of 1960 and 1969 indicates the growth was primarily composed of younger persons. In the age group 15-34, there were 270,600 more people in 1969 than 1960. This is 52.9 percent of the 511,800 people which were added to the population since 1960, more than twice the number expected if migration was held proportional to the age distribution in the State.

With an increase of younger persons in the population, we should have expected a rise in the birth rate and a decrease in the death rate even if the age-specific birth and death rates remained constant. Thus in the discussion following, some attention must be given to age-specific rates to determine trends.

Natality

The number of births in Washington increased in 1968 and again in 1969, each year raising the birth rate from the low of 16.6 in 1966 to 17.6 per 1,000 population in 1969. The national birth rate continued to decrease in 1968 to 17.6. However, in 1969, it also increased slightly to 17.7.

One notable area of the State, Island County, has continued with its high birth rates of 23.4 and 23.3 livebirths per

Figure 1. Birth and Death Rates, Washington State, 1920-1969 (Rates per 1,000 population)

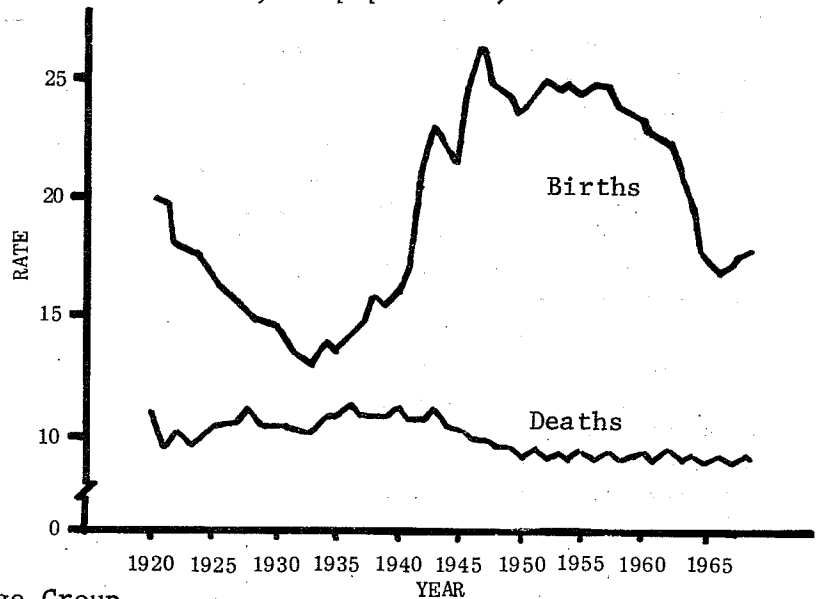

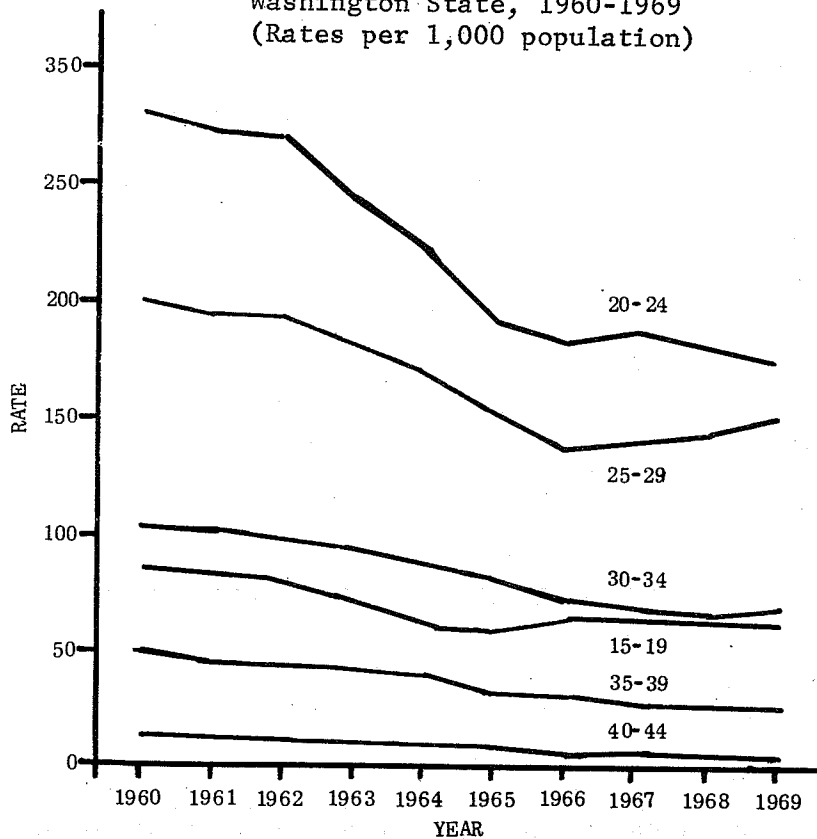

Figure 2. Birth Rates by Age Group, Washington State, 1960-1969 (Rates per 1,000 population)

1,000 estimated population in 1968 and 1969. A large number of young couples associated with the Naval Installation on Whidbey Island may be a factor involved in this.

There were more mothers aged 20-24 in 1968 and 1969 than in any other age group, but the age-specific birth rate from this segment has been falling off. The birth rate for the age group 25-29 on the other hand has been rising since 1965 (Figure 2).

The birth rates for the age groups 20-24 and 25-29 have fallen more sharply than in the other age groups. In spite of this, the median age of mothers has become younger. This is due to the increase of younger women in the population. Succinctly, more younger women are having fewer children. The result of these forces produced a low median age of 23.9 in 1967 as shown in Table 4. Increasing fertility rates in the 25-29 age group raised this to 24.0 in 1968 and it rose another tenth of a point in 1969 to 24.1.

These changes may indicate there is still a movement among mothers towards postponing birth until an older age perhaps resulting in smaller families in the future. The increasing percentage of livebirths which are first births certainly suggests the presence of such a trend.

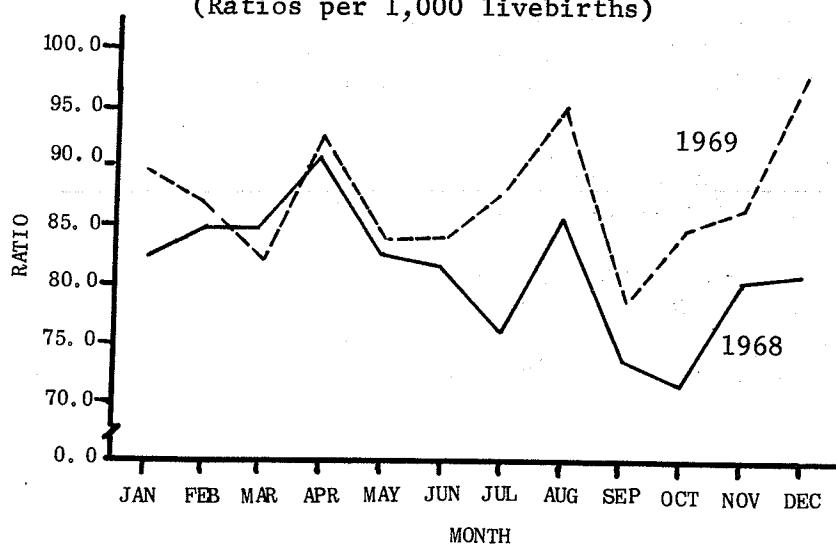

We may expect these trends to persist. There will be more females entering the highly fertile 20-29 age period in the 70's than in the 60's, a result of the high birth rates between 1950 and 1959. In general, "baby boom" daughters of the 50's are the contributing factors of the present increase.

The percentage of illegitimates also increased another point last year. Nearly nine percent of all births are now illegitimate. Table 17 in the appendix gives the ratios of illegitimate livebirths to total number of livebirths by age group. For mothers aged 15-19, 24.3 percent of all births are illegitimate in Washington. However, in the United States, studies from the National Center for Health Statistics indicated that another 42.4 percent of first births were to women who were married less than eight months. This suggests there were a larger number of conceptions occurring before marriage than those reflected by the illegitimate ratio.

Figure 3. Illegitimate Ratios, Washington State, 1968-1969
(Ratios per 1,000 livebirths)

Illegitimacy is primarily an urban phenomenon. The highest percentage of resident illegitimate births occurred in the cities of Aberdeen, Everett, Kennewick, Pasco, Seattle, Spokane, Tacoma, Walla Walla, Wenatchee, and Yakima in 1968 and 1969.

It is interesting that cities neighboring those mentioned had among the lowest ratios. Mercer Island near Seattle had resident illegitimate birth ratios of 44.0. The ratio in Puyallup near Tacoma was 70.2; in Mountlake Terrace near Everett it was 37.7; and in Richland near Pasco it was 57.7.

The number of illegitimate births invariably peaks and valleys from month to month. However, Figure 3 indicates there were two or three peaks of activity in 1968 and 1969. Illegitimate birth ratios were highest in April, August, December and January. It is interesting that the periods of conception correspond to these peaks also.

Mortality

The number of deaths in Washington also increased in 1968 and 1969 although the death rate has remained relatively stable, fluctuating mildly around 9.2 deaths per 1,000 population as it has since 1950. In 1968 and 1969, the death rates were both 9.1. These were slightly below the national figure of 9.4 for both years. The difference probably reflects the dissimilarities of the age distributions between the United State's and Washington's populations, a result of the in-migration of younger people into Washington.

Within Washington, Island County had the lowest death rate in 1969 at 6.4 deaths per 1,000 population. Garfield County had 15.2, the highest in the State. These differences undoubtedly reflect differences in the age distribution of these two counties. Island is basically a young county. A large percentage of the population there is involved in the Whidbey Island Naval Base. Garfield County, on the other hand, is an older farm-oriented populace. The communities of this region are small and the county has lost population since 1960.

In 1968, there were 138 male deaths for every 100 female deaths. In 1969, this ratio was also 138. The age group 15-24 had the highest sex ratio among those dying, the ratio being 325 males for every 100 females.

Diseases of the heart, cancer, cerebrovascular disease, accidents, and influenza and pneumonia have not changed as the five major vehicles of death for thirty years. Of these, the change in numbers of deaths from influenza and pneumonia between 1967 and 1968 was most dramatic resulting in 188 more deaths in 1968, a change of 19.8 percent. Influenza and pneumonia are strongly affected by the time of year. Epidemics that occurred between January and April took 44.7 percent of the deaths that occurred in 1968.

Deaths from cancer increased in 1968 and 1969, continuing a five-year trend. Heart disease accounted for fewer deaths in 1969.

Emphysema deaths increased both years. Within eight years, the number of lives emphysema has taken per year has more than doubled, making it a rapidly growing and important killer in Washington. Emphysema kills 5.4 times more men than women, and people aged 65-69 have the highest mortality.

In addition, emphysema is a prolonged disease; nearly fifty percent of the people who died in 1968 and 1969 were under the care of a doctor for over three years. The new rules regarding leading causes of death now group bronchitis, asthma, and emphysema. Grouping these causes of death resulted in the displacement of Diseases of Early Infancy as the fifth leading cause of death. Bronchitis has also been an increasingly important cause of death. In 1960, seventy people died from it, resulting in a rate of 2.5 per 100,000 population. In 1968, 109 people died, with a rate of 3.3, and in 1969, 98 people died with a rate of 2.8.

The accident death rate has experienced minor fluctuations throughout a ten-year increasing trend. Traffic accidents involve an increasing proportion of these. Forty percent of all accidental deaths involved motor vehicles in 1960. In 1968, this increased to fifty percent. The motor vehicle death rate per 100,000 population increased from 21.6 to 30.0. Although the 1969 rate decreased, it is difficult to predict an emergence of a new trend at this time.

In 1968, 49.1 percent of all accidental deaths occurred at home, due primarily to falls or fires. Fatalities occurring in the home amounted to 85.8 percent of all fire fatalities and 48.0 percent of all deaths due to falls.

The International Classification of Diseases, adopted for use in the United States, a structure which is used to encode mortality data, was changed in 1968. This change in itself was responsible for some of the fluctuations in number and rate observed in particular categories of death. The case of arteriosclerosis mortality was a notable example.

In 1968 the number of arteriosclerosis deaths dropped fourteen percent, from 818 in 1967 to 680, although the general trend through 1967 had been an increasing one. This decrease can be partly explained by the change in the coding structure. Correcting the 1967 deaths using the comparability ratio assigned to the arteriosclerosis category provided by the National Center for Health Statistics, there were 731 deaths instead of 818. Using this figure for 1967, then, indicates that arteriosclerosis only suffered a seven percent decrease in 1968. It is significant to note that deaths decreased in 1968, but the increase in 1969 to 756 deaths indicates that this shift was not permanent.

Two other increasing causes of death of interest were cirrhosis of the liver and homicide. Cirrhosis of the liver, often correlated to but not necessarily caused by alcoholism, resulted in sixty-seven more deaths in 1969 over 1968. The rate increased 1.7 percent to 13.9 in 1969. That portion of those deaths that mentioned alcoholism on the death certificate increased to 39.6 percent. The alcoholism death rate itself, increased to 4.0 per 100,000 population in 1969, the highest in a decade.

Both cirrhosis of the liver and alcoholism were diseases that had a very short treatment period before death ensued. In both situations the disease may have a long period of development, but treatment period as reported on the death certificate was of short duration. Less than thirty percent of those deaths from cirrhosis of the liver and only 22 percent of the deaths from alcoholism were reported to have been treated by a doctor for more than one year.

The number of deaths in Washington from homicide advanced from 114 in 1967 to 133 in 1968 and 131 in 1969. These produced a death rate of 3.9 per 100,000 population. Washington compared favorably with the national statistics which showed a rate of 7.5 in 1968. Over thirty percent of Washington deaths occurred in Seattle, with a rate of 8.1. This was expected since urban areas usually have higher rates from homicide than rural areas.

An increase in the number of suicides in 1969 raised the rate in Washington State to 13.8 per 100,000 population, and made it the tenth leading cause of death. There were 464 occurrences among residents and although the suicides have not increased significantly in the past ten years (Table 5), it still remains a major cause of death.

In Washington, 2.4 times as many men as women die by their own hand. This compares with a national rate of three to one. Among people younger than thirty years of age, who committed 23 percent of all suicides, the sex ratio was much higher. There were 3.9 times as many males as females who died by suicide. In the next thirty years of life, 52 percent of suicides occurred with a sex ratio of 196 males to 100 females. Those segments of the population that experienced the highest mortality from suicide were males between the ages of 25-29 and 50-54.

Most suicides were committed by whites. In 1969, whites accounted for 438 of the 466 deaths. Indians and blacks, however, still had the highest rates based on 1960 population estimates, the last time races were enumerated in Washington. In 1960, 391 white suicides resulted in a death rate of 15.1 per 100,000 population. The corresponding Negro and Indian death rates were 62.6 and 112.5 with 3 and 6 deaths, respectively. In 1969, there were again six Indian and six Negro suicides. Of course, the population had increased since 1960, but not to the extent required to push these rates down to the corresponding white rate.

Table 6 describes the frequency with which certain methods of self-destruction were used. Firearms accounted for fifty percent of all suicides and was chosen most often by men.

Females chose the use of barbiturates and other drugs, which was the next preferred method, twice as often as males. Nearly an exact inverse relationship existed in the fourth method of choice, hanging and suffocation. Males also comprised 79 percent of the group who died by gas poisoning, primarily from exhaust fumes containing carbon monoxide.

Infant Deaths

A slight increase in the number and rate of infant deaths (infants dying before their first birthday) was noticed in 1968. There were 1,120 infant deaths in 1968, increasing the rate to 19.6, up 0.5 from 1967. An increase in the number of births lowered the rate to 18.8 in 1969 since the number of infant deaths did not change drastically.

The greatest risk of death was to infants less than one week old. Sixty-five percent of all infant deaths occurred in this period. The specific conditions most responsible for this high rate were coded to Certain Causes of Mortality of Early Infancy. These include maternal diseases affecting the child, birth injuries, and anoxic and hypoxic conditions. They accounted for 80.9 percent of the deaths within one week. In contrast, only 22.4 percent of infant deaths between one week and one month were coded to this category. Congenital malformations was the largest cause of death in this age group.

The sex ratio at birth for 1969 was 105, however, the fetal death sex ratio was 120, and the infant death ratio was 151. In specific age groups as shown in Table 7 below, the highest sex ratio was 162 for infants between one and seven days old. The lowest sex ratio occurred from children dying up to four weeks later. This has been the trend in the last ten years.

The infant death ratio may be a sensitive index of the quality and availability of medical service. Beginning in 1966, emphasis was placed on improved public health nursing services to the Indian reservations in Washington State. In 1968, the Indian infant death ratio dropped forty percent. In comparison, the black infant death ratio fell twenty percent and the white ratio increased slightly. In 1969, the Indian ratio again decreased, whereas the other race ratios changed little. The reduced Indian ratio may have resulted from the extension of nursing services. In any case the change in the infant mortality ratio among Indians in 1968 was certainly one of the more significant vital statistic developments that year.

Marriage and Divorce

In 1968 a central registry for marriage and divorce records was created for Washington. The Bureau of Vital Statistics now collects and maintains these action records in Olympia, Washington. Statistics regarding marriage and divorce events are limited, however, by the form of the certificate itself and the present impossibility of collecting comparative information from the certificates of events prior to 1968, which were kept in county offices.

Over twenty percent of the 40,966 marriages that occurred in 1969 were between couples where one or both members were not residents of Washington State. The counties with a high percentage of marriages between out of state residents are Clark and Skamania primarily. The proximity to Portland permits a number of Oregonians to marry here.

These counties also have a high percentage of civil marriages. In Washington, 24.5 percent of all marriages in 1968 were performed outside of a religious setting. In Clark county, this percentage was 49.6, and in Skamania it was reported to be 90.4.

There were 16,507 divorce actions granted in 1969. Cruel treatment was given as the grounds for divorce in 92.2 percent of the cases and, most often, the wife was granted the divorce on these grounds. Separation of the husband and wife for a period of two years or more constituted grounds for divorce for 6.1 percent of the cases. This was the second choice for Washington actions in 1968 and 1969.

The plaintiff in a divorce action might not necessarily be the sole party receiving judgement. In 1968 and 1969, in fact, both husband and wife won fewer cases than the number of actions filed in which they were plaintiff. The remaining judgements, 3.2 percent of all filings, were granted to both parties.

Children were involved in 85.6 percent of all divorces granted in 1969. Families with one or two children constituted 63.4 percent of these.
