## Dog and Cat Management Protocol for Potential Rabies Exposures

Dog/cat bites or scratches a person	<ul> <li>If animal is not showing signs of rabies, instruct the owner to confine (prevent escape, prevent bites or scratches to additional people) for 10 days from the date of the bite and observe for signs of rabies.* <ul> <li>If the animal remains healthy for 10 days, it does not have rabies. If the animal is unvaccinated or not up-to-date, give a rabies vaccination at the end of the 10-day isolation.</li> <li>If the animal develops signs of rabies, dies, or needs to be euthanized due to humane reasons, call Public Health** to discuss rabies testing.</li> </ul> </li> <li>If animal is showing signs of rabies, call Public Health** to discuss euthanasia and rabies testing.</li> </ul>
Dog/cat is exposed to a rabid animal^	<ul> <li>Review: <u>Handling calls about bat encounters</u></li> <li>Call Public Health** for observation and confinement recommendations. The length of a confinement period is based upon vaccination history of the exposed animal and is generally 45 or 120 days (4 months). All exposed animals should receive a rabies vaccination within 96 hours of exposure.</li> </ul>

\*Early symptoms may include lethargy, fever, vomiting, and anorexia. Later symptoms may include ataxia, seizures, difficulty breathing, excessive salivation, and abnormal behavior.

\*\*Contact your local health jurisdiction, more information can be found <u>here</u>. You can also call WA Communicable Disease Epidemiology at 206-418-5500 or toll-free 877-539-4344.

^Typically bats in Washington state. Bats that are not available or suitable for rabies testing should be regarded as rabid.

NOTE: Public Health should be consulted for management of other pets, such as ferrets, and livestock.
