Lopez Island SE
Annual Shellfish Growing Area Review

Prepared By: Kelly Curtis
Area: Lopez Island SE
Year Ending: December 31, 2019
Classification: Restricted

Activities in the Growing Area in 2019
The growing area was initially classified, encompassing 9,900 acres, in response to a subtidal harvest request for scallops. Currently, there are no permanent marine water stations within the growing area and, therefore, the area is classified as Restricted. Commercial harvest will require a relay to an Approved or Conditionally Approved commercial shellfish growing area. Warm season and cold season validation studies must be completed for each harvest area and grow-out site.

Analytical Results of Water Samples
There are no marine stations currently in the growing area. Once a relay validation study is conducted, a marine station will be placed in the growing area solely for the purposes of approving relay harvest activities. No bacterial samples will be required from this station.

Change in Actual Pollution Sources that Impact the Growing Area
We currently have no information indicating that the area has new sources of pollution.

Classification Status
- Well within the classification standards
- Meets standards, but some concerns
- Meets standards, but threatened with downgrade in classification
- Fails to meet current classification standards

Remarks and Recommendations
The area meets the appropriate standards to be classified Restricted.
