INTRODUCTION

The purpose of the Stroke Education Toolkit is to have stroke education resources in one easy to find place for use during National Stroke Awareness Month (May) and throughout the year to educate patients, the public, and staff about stroke. Intended users are staff at healthcare facilities and services, emergency medical services, and community services. The emphasis is on acute stroke but some information about risk factors and prevention is included. It is not intended to include every stroke education resource available.

Thanks go to Valerie Lyttle, RN, MSN, CEN, CNRN, SCRN, Stroke Program Coordinator, MultiCare Good Samaritan Hospital, for the original Toolkit produced in 2012. Additionally, we would like to thank the American Heart Association/American Stroke Association, the CDC Division for Heart Disease and Stroke Prevention, Million Hearts, the National Stroke Association, the National Institutes of Health, and the Health Promotion and Communication Section of the Office of the Assistant Secretary at the Washington State Department of Health for the resources that are included in this toolkit.

This update is provided by the WA State Department of Health, WA Coverdell Acute Stroke Program.

For information about the toolkit, contact:

Kim Kelley, MSW
Coverdell Stroke Program Coordinator
WA State Department of Health

This publication was supported by the Grant or Cooperative Agreement Number, DP006075, funded by the Centers for Disease Control and Prevention.

Its contents are solely the responsibility of the authors and do not necessarily represent the official views of the Centers for Disease Control and Prevention or the Department of Health and Human Services.
KEY FACTS AND MESSAGES

• **Stroke is a “brain attack”**
  Stroke is often called a “brain attack” because it affects the arteries leading to and within the brain. A stroke happens when an artery that carries oxygen and nutrients to the brain is either blocked by a clot or ruptures. When that happens, part of the brain cannot get the blood and oxygen it needs and starts to die.

• **Ischemic stroke**, about 80 percent of all strokes, is caused by a severe blockage of blood to part of the brain. Most commonly, blood flow through an artery is blocked by atherosclerosis (narrowed arteries).

• **Hemorrhagic stroke** occurs when arteries leak or rupture, causing bleeding into or around the brain.

• Every 40 seconds someone has a stroke.

• Stroke is the leading cause of serious long-term disability in adults.

• Be a Stroke Hero: Learn the signs and symptoms of stroke and call 9-1-1 immediately if you think you or someone you’re with is having a stroke.

• **Signs of stroke**
  o Sudden numbness or weakness of the face, arm or leg, especially on one side of the body.
  o Sudden confusion, trouble speaking or understanding.
  o Sudden trouble seeing in one or both eyes.
  o Sudden trouble walking, dizziness, loss of balance or coordination.
  o Sudden severe headache with no known cause.

• If you see even one of these signs, call 9-1-1 immediately! Minutes matter!

• Time is brain – there is a short period of time after the symptoms start, when serious damage can be prevented. Rehabilitation after a stroke helps people overcome disabilities that result from damage to the brain.

• Think F.A.S.T for the most common signs and symptoms of stroke, and call 9-1-1 immediately if you or someone you’re with has signs of a stroke.
FACE  Ask the person to smile. Does one side of the face droop?

ARMS  Ask the person to raise both arms. Does one arm drift downward or not move?

SPEECH  Ask the person to repeat a simple sentence. Is speech slurred or hard to understand? Are they unable to speak?

TIME  Time to call 911 if you see any one of these signs. Note the time symptoms started, or when the person was last known to be normal and tell the medics.

- The faster stroke is treated, the more likely the patient will recover. Patients who are treated within 90 minutes of their first symptoms are almost three times more likely to recover with little or no disability.

- Calling 911 at the first sign of stroke is critical. Our state’s system is activated the moment you call. Emergency medical service responders are specially trained on stroke assessment and they alert the hospital in advance so stroke patients get seen and treated faster.

- A stroke can happen to anyone, at any time and at any age. Learn to recognize a stroke, because in a stroke emergency, time lost is brain lost. For every minute you don’t get help, more brain cells die.

- High blood pressure is the leading cause of stroke and the most important controllable risk factor for stroke.

- 80% of strokes are preventable.

- You can reduce your risk of stroke by addressing these modifiable risk factors:

  - High blood pressure
  - Overweight
  - Cigarette smoking
  - High cholesterol
  - Diabetes
  - Physically inactive
  - Poor diet

- Many people in Washington die or are disabled from stroke because they do not get lifesaving treatment in time. The sooner you’re treated, the better your chances of recovery and getting back to your normal activities. Calling 9-1-1 when you or someone else is
experiencing stroke symptoms activates the Washington State Emergency Cardiac and Stroke System. The system is designed to get you to the right place, in time for the right treatments. To learn more about Washington’s Emergency Cardiac and Stroke System, visit www.doh.wa.gov/ecs.

- People who experience stroke benefit from rehabilitation services. Rehabilitation helps improve function and quality of life.
Statistics

National Statistics
Source: American Stroke Association 2018

- Someone in the US has a stroke about once every 40 seconds.
- Stroke accounts for 1 of every 19 deaths in the US.
- Stroke kills someone in the US about every 3 minutes 45 seconds.
- When considered separately from other cardiovascular diseases, stroke ranks No. 5 among all cause of death in the US, killing nearly 133,000 people a year.
- From 2005 to 2015, the age-adjusted stroke death rate decreased 21.7 percent, and the actual number of stroke deaths declined 2.3 percent.
- Each year, about 795,000 people experience a new or recurrent stroke. Approximately 610,000 of these are first attacks, and 185,000 are recurrent attacks.
- Stroke is a leading cause of serious long-term disability in the US.
- Projections show that by 2030, an additional 3.4 million US adults aged 18 and older, representing 3.88% of the adult population, will have had a stroke, a 20.5% increase in prevalence from 2012. The highest increase (29%) is projected to be in white Hispanic males.
- In 2013, worldwide prevalence of stroke was 25.7 million, with 10.3 million people having a first stroke.
- Stroke was the second-leading global cause of death behind heart disease in 2015, accounting for 11.8 percent of total deaths worldwide.
- A recent study estimated financial cost of strokes in the U.S. will soar to more than $2.2 trillion over the next 45 years if no action is taken to improve preventive care or treatment.

AHA National Heart and Stroke Statistics
2018 Statistics at a glance

Washington State Statistics
Source: WA State Department of Health

- Stroke is the 6th leading cause of death in Washington, with 2,700 dying from stroke in 2015 (about 7 deaths per day), and the leading cause of preventable disability for adults.
- Black and American Indian/Alaskan Native populations in Washington are more likely to die from stroke than whites.
• The rate of death from stroke is higher in areas with higher poverty levels.
• There were over 15,000 hospitalizations for stroke in 2015.
• Hospital charges for stroke in 2015 were over $820 million, an average of $54,000 per stroke.
• About 8% of all ischemic stroke patients get t-PA. This includes patients who are not eligible for t-PA because they arrive too late or have other contra-indications.
• The number of people experiencing strokes is expected to increase as baby boomers age, putting them at increased risk of premature death and disability from stroke, and trends show more strokes in people under 55 years of age.
• More than a quarter of Washingtonians are living with obesity, hypertension or high cholesterol, major risk factors for stroke.
RESOURCES FOR PATIENT AND COMMUNITY EDUCATION

The following websites contain brochures, flyers, banners, tweets, infographics and other useful tools.

American Heart Association/American Stroke Association:
- Stroke Month Campaign
- American Stroke Association Stroke Resource Center
- One simple dual purpose flyer Life’s Simple Seven to Prevent a Stroke (page 1; FAST messaging on page 2)

National Stroke Association Stroke Awareness Resources

Centers for Disease Control Stroke Patient Education Handouts

National Institutes of Health Downloadable posters, toolkits for order (including Spanish)

Million Hearts Education Tools

DOH Blood Pressure Materials - type “blood pressure” in the search field and it will bring up brochures and posters that can be requested from DOH (see below) or downloaded and printed locally. Most are available in multiple languages (Chinese, English, Spanish, and Vietnamese)

The following interview guide can be used when interviewing a stroke survivor in your community.

**Preparing for the interview and publishing the article**

1. Identify a stroke survivor to interview.

2. When contacting the interviewee to obtain consent for the interview:
   - Introduce yourself.
   - Describe the purpose of the interview.
   - Explain that you have a few questions prepared and offer to show them the questions ahead of time.
   - Reassure them that their participation is entirely optional.
   - Answer any questions that they might have about the use of their name and, if applicable, photograph.
   - Make sure that they understand where the interview will be posted and the implications of that exposure (how many members of the public may see their name or photo).

3. Submit the interview for inclusion in an upcoming agency newsletter, bulletin, or on social media.

**Suggested Interview Questions**

1. Tell us a little about yourself
2. When did you experience the stroke and how did you know that you were having a stroke?
3. What happened next? What steps did you take to get help?
4. What treatment did you receive at the hospital and what was your rehabilitation process like?
5. What steps do you take now to prevent stroke?
6. What advice would you give to someone who has recently experienced a stroke?
7. What message do you have for the general public about stroke and stroke prevention?

Suggested Article Structure and Text

I. Introduction

Every 40 seconds, someone in the United States has a stroke. Strokes are a leading cause of disability in the United States, but did you know that there are steps that you can take to reduce the impact of stroke and improve stroke recovery? With stroke, it is critical to think **FAST**! F-Face drooping; A-Arm weakness; S-Speech difficulty; T-Time to call 9-1-1. If you, or someone around you, is showing these signs of stroke, do not hesitate and call 9-1-1 right away. By doing so, you are giving yourself or another individual the best chance of minimizing the long-term effects of stroke.

Here at [your agency name], we would like to take this opportunity to highlight the story of a stroke survivor—an individual who has thrived after stroke. We took some time to get to know [name of interviewee], who shares with us [his/her] story of resilience.

II. Interview

III. Conclusion

Remember - stroke can happen to anyone at any time. Knowing the warning signs of stroke and calling 9-1-1 immediately can make you a stroke hero—both for yourself and others in your community.
This section will be updated soon to include the Washington State 2018 Stroke Proclamation

Think and act F.A.S.T. in case of a stroke

Strokes kill more than 2,700 Washington residents each year. Others survive, but with significant, costly disabilities. That’s why it’s important to think and act F.A.S.T. when someone near you displays stroke symptoms.

What does F.A.S.T. mean? It’s an acronym for a simple way to determine whether a person might be having a stroke:

- **Face**
  Ask the person to smile. Does one side of the face droop?

- **Arms**
  Ask the person to raise both arms. Does one arm drift downward or not move?

- **Speech**
  Ask the person to repeat a simple sentence. Is speech slurred or hard to understand? Are they unable to speak?

- **Time**
  Time to call 911 if you see any one of these signs. Note the time symptoms started, or when the person was last known to be normal and tell the medics or hospital staff.

The signs and symptoms of a stroke include:

- Sudden numbness or weakness of the face, arm or leg, especially on one side of the body.

- Sudden confusion, trouble speaking or understanding.
• Sudden trouble seeing in one or both eyes.
• Sudden trouble walking, dizziness, loss of balance or coordination.
• Sudden, severe headache with no known cause.

Acting fast is crucial. Many people experiencing stroke die or are disabled because they don’t get the appropriate medical treatment in time. For stroke, that means within three hours, or in some situations up to six hours. The sooner people are treated, the higher the chances they’ll recover and return to normal activities. Activating Washington’s Emergency Cardiac and Stroke System by calling 9-1-1 speeds treatment, but fewer than half of stroke patients use 9-1-1 to get to the hospital. Patients arriving by ambulance get treated faster in part because medics call ahead so the hospital is ready for the patient when they arrive.

“Calling 9-1-1 is essential,” said State Health Officer Dr. Kathy Lofy. “Friends and family members may have good intentions when they take people with stroke symptoms to the hospital, but it’s much better to get emergency medical personnel on the scene as soon as possible. Lost time often leads to a worse outcome.”

The Washington State Department of Health participates in the Paul Coverdell National Acute Stroke Program. This initiative builds on the improvements achieved through the Emergency Cardiac and Stroke System, and will further improve stroke care and outcomes.

Stroke is the fifth leading cause of death nationwide, and the sixth leading cause in Washington. It is also a leading cause of severe, long-term disability. The number of strokes is projected to increase by 20.5 percent between 2016 and 2030, and the direct medical costs for treating stroke are expected to almost triple, from $71.6 billion to $184.1 billion by 2030, according to the American Stroke Association, a division of the American Heart Association.

May is Stroke Awareness Month, with a focus on improving the number of stroke patients who receive lifesaving treatment in time. Stroke Awareness Month is the American Stroke Association’s and the National Stroke Association’s call to increase awareness of stroke, and to inspire citizens to learn about the signs of stroke and how to react.

May is American Stroke Month – think and act F.A.S.T. in case of a stroke

CITY, WA — Washington Governor [name] has proclaimed May as "Stroke Awareness Month" as part of a statewide call to increase awareness of stroke warning signs and improving the number of stroke patients that receive lifesaving treatment in time.

Many people in Washington die or are disabled from stroke because they do not get the appropriate medical treatment within the recommended time window, which is three hours for the most common type of stroke. Increasing the number of stroke patients who get timely treatment is one of the goals of Washington’s Emergency Cardiac and Stroke System. To activate the system, citizens must be more vigilant about recognizing the stroke warning signs and immediately calling 9-1-1 when they or someone else is experiencing stroke symptoms.

Stroke is the fourth leading cause of death nationwide and a leading cause of severe, long-term disability, according to the American Stroke Association. “Stroke is a life-threatening medical emergency. For every minute you don’t get help, more brain cells die, increasing the likelihood of permanent disability or even death. The best way to get medical treatment quickly is to call 9-1-1,” said SPOKESPERSON NAME, TITLE.

An easy way to recognize stroke is to think F.A.S.T.:

FACE Ask the person to smile. Does one side of the face droop?
ARMS Ask the person to raise both arms. Does one arm drift downward or not move?
SPEECH Ask the person to repeat a simple sentence. Is speech slurred or hard to understand? Are they unable to speak?
TIME Time to call 911 if you see any one of these signs. Note the time symptoms started, or when the person was last known to be normal and tell the medics.
Face droop, Arm weakness, and Speech difficulty are the most common signs and symptoms of stroke. Additional signs and symptoms are sudden numbness or weakness of the face, arm or leg, especially on one side of the body; sudden confusion or trouble understanding; sudden trouble seeing in one or both eyes; sudden trouble walking, dizziness, loss of balance or coordination; and sudden severe headache with no known cause.

Washington has changed the way emergency medical services (EMS) respond to cardiac and stroke patients. With the new Washington State Emergency Cardiac and Stroke System, modeled after the state’s trauma system, standard guidelines for EMS call for patients to be taken directly to a hospital that can provide specialized care. If there isn’t one close by, patients will be rapidly assessed by the local hospital and transferred immediately to the treating hospital. The public can help by learning heart attack and stroke symptoms and calling 9-1-1 immediately when they or someone else is experiencing these symptoms.

Stroke Awareness Month is the American Stroke Association’s and the National Stroke Association’s call to increase awareness of stroke and to inspire citizens to learn about the signs of stroke and how to prevent a stroke. To learn more about Washington’s Emergency Cardiac and Stroke System, visit www.doh.wa.gov/ecs.
I was certain I’d been stabbed above my right eyebrow. While running a 3.5-mile race in May 2013, I felt a sudden, piercing pain in my forehead at precisely the one-mile marker. I was 27 years old, in the best shape of my life, and had trained for this race for months. I couldn’t stop now. I squeezed my eyes shut to cope with the pain.

One foot in front of the other. By the time I crossed the finish line, my left hand no longer worked to open a water bottle. I fell while trying to stretch. Bystanders at the finish line noticed that one side of my face was drooping and took me to the medical tent in a wheelchair.

Fortunately, a physician was there to examine me and I’ll never forget his instant diagnosis: “Emily, you are having a stroke.”

At my age, no one ever expects to hear those words. But I barely had a moment to process them. All of a sudden I was being rushed to the hospital in an ambulance. Thanks to American Stroke Association guidelines, the hospital team was ready for me when I arrived.

Immediately a CT scan was performed, which confirmed an ischemic stroke, caused by a blood clot on the right side of my brain. Already a small portion of my brain tissue had died.

Looking back I am extremely grateful that bystanders at the finish line recognized my symptoms as something serious and that I got to the hospital quickly. When it comes to stroke, time is brain. Nearly two million brain cells die for every second that a stroke goes untreated.

Luckily for my type of stroke, there is a drug called tPA that can eliminate a clot and reverse the effects of a stroke, but it must be administered within a 3- to 4-hour window. I received tPA with one hour to spare.

In Washington, we have the Emergency Cardiac and Stroke System of Care. It is designed to speed up care and save lives. Calling 911 triggers the system – operators are trained to identify stroke and dispatch an ambulance.
first responders notify the hospital while the patient is in transport, and the hospital stroke team is ready to diagnose and treat the patient upon arrival.

Washington stroke patients are receiving treatment faster: 48 minutes from the time they arrive at the hospital until the administration of tPA, according to the American Stroke Association, compared to 75 minutes in 2011 when the system went into effect. The goal was 60 minutes or less.

I can tell you that recovering from a stroke is challenging. It took many months of physical and occupational therapy to regain strength on my left side. I had to re-learn how to add and subtract. But today I am running again and even finished the Boston Marathon in April 2015.

I know not all stroke patients are as fortunate, but you can make a big difference. Know the warning signs of a stroke. Think F.A.S.T – F for face drooping; A for arm weakness; S for speech difficulty; and T for time to call 911.

Time is the number one factor in reducing the likelihood of death or disability from stroke. By knowing the warning signs and dialing 911, you can give someone the opportunity to thrive after a stroke and not just survive.

Emily Welbourn works as business development director for the American Heart Association/American Stroke Association in Tacoma. She previously was a volunteer with the organization.

**EXAMPLES OF PUBLIC AND EMPLOYEE EDUCATION ACTIVITIES FOR STROKE MONTH**

- Play stroke videos in strategic locations (see section above with links to videos)
- Staff in-services
- Educate through employee wellness programs like SmarthHealth and give points
- Do FAST awareness education to hospital valet, housekeeping, transport, and food service teams
- Post FAST/blood pressure/Life’s Simple Seven posters in exam rooms, waiting rooms, bathrooms, by drinking fountains, on fridges
- Stickers on the café's plan java jackets
- Printed java jackets
- Give out FAST bags and have a table at farmers markets
- Get FAST on school digital boards
- Neuroanatomy class for non-neuro nurses with edible teaching aids (body part gummies include brains, Oriental Trading; Google gummy brains; there are even life-size gummy brains, and chocolate and jello molds)
- Daily internet messages on hospitals website
- Tweets and retweets
- Facebook messages, Facebook live events – interview EMS, stroke coordinators, neurologists, etc.
- Infographics
- Health fairs
- Table tents in cafeterias
- Ambulance wraps
- Messaging on buses
- Media outreach
- Physician talk
- Get interview or PSAs on local radio
- Info tables, blood pressure checks at health fairs
- Presentation/handouts/blood pressure checks at the local senior center on S/S of a stroke, prevention, and general stroke information
- FAST flyers in hospital/other billing statements
- Hospitals and hospital systems often have thousands of employees so even internal promotion can reach a wide audience
- Collaborate with local public health
- Work with area [agencies on aging](#) to reach the senior population through their vast network
EMS councils and regions who have a role in prevention and education, although no dedicated resources for cardiac and stroke education
COMMUNITY EVENTS

**What:** Seattle Mariners 2018 Strike Out Stroke

**When:** Saturday, May 19th at 6:10 pm

**Where:** Safeco Field

**For More Information Go To:**
