Perinatal Hepatitis B Prevention Program: Goal and Objectives

Federal recommendations

The Washington State Department of Health (DOH) Office of Immunization and Child Profile (OICP) follows federal recommendations for hepatitis B immunization. These recommendations, made by the Advisory Committee on Immunization Practices (ACIP), include control of perinatal hepatitis B virus infection (HBV). The latest updated ACIP recommendations target delivery hospital policies, procedures, and case management programs.

To provide appropriate clinical care to a newborn, you must put the mother’s data in the infant’s medical record, as recommended by ACIP. This does NOT violate the Health Insurance Portability and Accountability Act (HIPAA). The HIPAA Privacy Rule allows the use of some health information:

“A covered entity is permitted, but not required, to use and disclose protected health information, without an individual’s authorization, for the following purposes or situations: (1) To the Individual; (2) Treatment, Payment, and Health Care Operations...”

Find a summary document of the HIPAA Privacy Rule here.

Goal

Washington State’s Perinatal Hepatitis B Prevention Program (PHBPP) has an overall goal to work with partners to assure coordination of activities to prevent perinatal hepatitis B transmission to newborns. The program has several key elements.

- It is both a surveillance and case management program to help manage perinatal hepatitis B cases.
- It promotes universal birth dose.
- It relies on multiple reporting mechanisms.
- It works with partners to assure coordination of activities.
Local health jurisdictions in our state are key in completing these tasks, including supporting effective delivery hospital policies specifying birth dose vaccinations, standing orders, and case management to:

- Identify HBsAg-positive pregnant women.
- Ensure HBV DNA testing is done for all HBsAg-positive pregnant women to guide the use of maternal antiviral therapy during pregnancy for the prevention of perinatal HBV transmission.
- Make sure their babies get proper post-exposure prevention. Correct post-exposure prevention for babies includes hepatitis B immune globulin (HBIG) and hepatitis B vaccine within 12 hours of birth, followed by two more doses of vaccine (at 1-2 months and 6 months of age).
- Make sure post-vaccine testing is completed.
- Report all data on administration of follow-up doses of vaccine and post-testing of the infant to DOH.

### Objectives

1. **100% of all pregnant women get screened for HBsAg prenatally or at delivery.**
2. **100% of delivery hospitals adopt policies, procedures, & standing orders for HBsAg verification & for testing mothers at delivery.**
3. **At least 90% of expected births to HBsAg-positive mothers are identified.**
4. **At least 95% of babies born to HBsAg-positive mothers get HBIG and 1 dose of hepB vaccine within 12 hours of birth and 3 vaccine doses by 6 months.**
5. **At least 90% of these babies get a blood test (HBsAg and anti-HBs) 1-2 months after the last dose of hepB vaccine or by 9-12 months.**
6. **100% of all HBsAg-positive babies get reported to DOH and CDC through the National Notifiable Disease Surveillance System.**
Hepatitis B Facts

**Acute** (short-term) and **chronic** (long-lasting) effects of hepatitis B virus (HBV) infection are a major health problem.

About 79,000 infections occur in the U.S. each year; 21,000 of those cases are acute (short-term) and symptomatic (showing symptoms) (Centers for Disease Control and Prevention).

As many as 1.6 million people in the U.S. have chronic HBV and can potentially spread the disease to others.

Hepatitis B is a leading cause of liver cancer in the U.S. HBV can be passed from mom to baby during birth (perinatal infection). About 25,000 HBV-infected moms give birth each year in the U.S. Infants infected at birth may later experience potentially deadly complications, like chronic liver disease and liver cancer. Each year, about 4,000 to 5,000 people die from chronic liver disease.

Hepatitis B infection in the Asian-Pacific Islander population is 10%. That’s 60 times higher than the infection rate of the general population.

The number of foreign-born residents living with chronic hepatitis B will continue to increase with ongoing immigration from countries where hepatitis B is common.

Unless they get proper post-exposure prevention, up to 90% of babies born to mothers with hepatitis B get infected, and 85% to 95% of those will be chronically infected. Up to one in four chronically infected babies will die from primary hepatocellular carcinoma or cirrhosis of the liver later in life.

While screening rates are high, reporting rates of HBsAg-positive pregnant women remain a problem. Nationally, about 95% of pregnant women receive prenatal HBsAg serologic testing, yet only 47% of expected births to HBsAg-positive pregnant women are identified and reported to perinatal hepatitis B programs (CDC Peritable Outcomes, 2014).

Getting immunized with hepatitis B vaccine is the most effective way to prevent HBV infection. Pregnant women who are infected with HBV can prevent giving HBV to their babies at birth if the baby gets:
- Hepatitis B immune globulin (HBIG) and hepatitis B vaccine within 12 hours of birth
- Additional doses of vaccine at 1-2 months and 6 months of age.

CDC recommends testing **all** pregnant women for HBV early in each pregnancy even if they already had the vaccine or test. Women who test HBsAg-negative early in pregnancy but are in a high-risk category for HBV should be retested at the delivery hospital.

Pregnant women who test HBsAg positive should be referred to the local health jurisdiction’s PHBPP and receive counseling, medical management, and information about HBV. **Emerging evidence** suggests HBV treatment during the third trimester is safe and reduces rates of transmission.
Hospital Tasks Overview

The following four strategies guide hospitals to prevent perinatal hepatitis B transmission. Also see the Immunization Action Coalition’s hepatitis B hospital guide.

1) Screening procedures
Develop and follow a written policy and procedure to screen every pregnant woman admitted for delivery for HBsAg who has an unknown hepatitis B status and is at risk for HBV infection during pregnancy. Women with unknown status include those with no prenatal care or who have not already been tested. Risk behaviors for HBV include:

- More than one sexual partner in the previous 6 months.
- Evaluation or treatment for sexually transmitted disease.
- Recent or current injection drug use.
- HBsAg-positive sexual partner(s).
- Clinical hepatitis since previous testing.

Include in your written policy the following procedures for each stage of the hospital stay for women delivering babies (admission, after delivery, standing orders, infant discharge).

Admission for Delivery:
- Review hepatitis B surface antigen (HBsAg) status of all pregnant women.
- Review HBV DNA testing for all pregnant women that are HBsAg-positive.
- Record maternal HBsAg & HBV DNA test results on both the labor delivery record and on the infant’s delivery summary sheet.
- Do HBsAg testing as soon as possible on women who do not have an HBsAg test result, who have risk for HBV infection during pregnancy, and who had clinical hepatitis since previous testing.

After Delivery:
- Identify and manage all infants born to HBsAg-positive mothers, and infants born to mothers with unknown HBsAg status.
- Give HBig and hepatitis B vaccine dose 1 to infants of all HBsAg-positive pregnant women, within 12 hours of birth.
- If the mother’s HBsAg test results are unavailable but evidence suggests of maternal HBV infection, the infant should be managed as if born to an HBsAg-positive mother.
- Document the mother’s HBsAg-positive status and the infant’s HBig and hepatitis B vaccine doses at the hospital; give this information to the pediatric care provider.

Standing Orders:
- Review HBsAg and HBV DNA test results for every pregnant woman admitted for delivery. Make sure all mothers have been tested for HBsAg.
prenatally or at time of admission. Document the test results.

- For women with no HBsAg test results, test them as soon as possible after admission for delivery.
- Premature babies born to HBsAg-positive mothers or mothers with unknown status must get HBIG AND hepatitis B vaccine within 12 hours after birth. If these babies weigh less than 2,000 grams at birth, do not count the first dose of hepatitis B vaccine as one of the doses in the series. The baby should get 3 additional doses of hepatitis B vaccine, starting when medically stable and at least 1 month of age (MMWR, 2018). This will be a total of 4 doses.
- For all infants, add the mother’s HBsAg test results to the infant’s medical record, and the date and time the infant got HBig and hepatitis B vaccine.

**Time of Infant Discharge:**
Give the infant’s immunization record to the mother and remind her to take it to the baby’s first pediatrician visit.

2) **VFC (Vaccines for Children Program)**
For all delivery hospitals: Enroll in the federal VFC program to get free birth-dose hepatitis B vaccine for eligible newborns. Eligible newborns include Medicaid eligible, American Indian or Alaska Native, underinsured, or uninsured babies.

3) **Notification**
Notify your local health jurisdiction (LHJ) of the birth of an infant to an HBsAg-positive mother so follow-up can begin for the infant and for the mother’s household contacts and sexual partners. **State law requires you to report** every HBsAg-positive pregnant woman. Your LHJ provides case management and follow-up services for these infants and contacts.

4) **Information for the patient**
Counsel and provide information on these subjects to every HBsAg-positive woman who is pregnant or has just delivered:
- How hepatitis B spreads.
- How to prevent hepatitis B.
- The need for her to get medical follow-up with a liver specialist.
- Her infant’s need to get protection. The baby needs HBig and hepatitis B vaccine within 12 hours of birth, two additional doses of hepatitis B vaccine at 1-2 and 6 months of age, and post-vaccine screening at 9-12 months of age.
- The need for her household contacts and sexual partners to get pre-vaccination screening. If any of these people prove at risk, they need to get three doses of hepatitis B vaccination at intervals of 0, 1-2, and 4-6 months.
- How her LHJ will contact her to follow-up with necessary services for her family.
Case Management Snapshot

Managing a perinatal hepatitis B case always starts with the pregnant woman and involves pre-screening, opening a confidential case report in the module, tracking the woman’s baby, following up with phone calls and mail, and closing a case when follow-up is finished. Cases may be open for as long as two years. Find a visual snapshot of this process below.

START: Health care provider pre-screens pregnant woman in first trimester of pregnancy.

HBsAg test is NEGATIVE.

No hepatitis B case.

HBsAg test is POSITIVE.

To guide the use of antiviral therapy during pregnancy for prevention of perinatal HBV transmission a HBV DNA test should be done for all HBsAg-positive pregnant women.

Based on pre-screening, Hep B Coordinator either:
- Refers contacts and partners to a specialist or
- Makes sure contacts and partners get vaccinated and post-tested.

Hep B Coordinator opens a confidential case on the HBsAg-positive woman using “New Case” in the Perinatal Hepatitis B Module.

BABY is BORN!
Hospital gives HBIG and birth dose of hepatitis B vaccine.

Hep B Coordinator calls hospital for infant’s information and dates of HBIG and hepB vaccine. Hep B Coordinator enters infant information into the mother’s open case in the Perinatal Hepatitis B Module.

When all follow-ups with mother and baby have been documented for pre-screenings, HBIG, vaccination series and post-testing, Hep B Coordinator “closes” the open case in the Perinatal Hepatitis B Module.

Hep B Coordinator works with mother & pediatrician to make sure baby gets full vaccination series and post-testing.

Also, cases get closed for other reasons.

Health care provider or hospital reports HBsAg-positive woman to LHJ Hepatitis B Coordinator.

Hep B Coordinator closes a case for other reasons, such as if mother refuses follow-up, can’t be located, or if the pregnancy ends.

Also, cases get closed for other reasons.
Required Notification

Washington state follows three levels of required notification for certain medical conditions to prevent and control communicable and noninfectious diseases. Different agencies take care of these different notification levels.

7. Notification to local health jurisdictions (LHJ): by every prenatal health care provider or hospital.

Washington considers EACH pregnancy in any HBsAg-positive woman a notifiable condition. This can increase the chance that babies born to HBsAg-positive mothers will get proper post-exposure prevention. Because of this, the notifications must happen correctly as explained and shown in the picture below.

7. Healthcare providers notify the LHJ Perinatal Hepatitis B Coordinator of the pregnant woman's status.
8. The Hepatitis B Coordinator then enrolls the woman in the Perinatal Hepatitis B Prevention Program, manages her case (including her baby, household contacts, and sexual partners), and notifies the correct agency programs.
9. DOH notifies CDC weekly about all hepatitis B-infected infants.

**Notification Process**

- **Pregnant woman** tests HBsAg-positive at her **prenatal care provider, healthcare provider, or the hospital.**
- **Provider or hospital** notifies local health jurisdiction's **Hepatitis B Coordinator.**
- **Hepatitis B Coordinator**
  - Contacts HBsAg-positive woman to enroll her in Perinatal Hepatitis B Program.
  - Notifies DOH of pregnancy and outcomes at:
    - Communicable Disease Epidemiology at 206-418-5500 or in PHIMS
    - DOH Office of Immunization and Child Profile-360-236-3595
- **DOH staff** notify CDC of each positive hepatitis B case.
Required Reportable Conditions

Hepatitis B Surface Antigen (HBsAg) Positivity During Pregnancy

Since December 2000 in Washington State, HBsAg-positive status during pregnancy has been a required reportable condition per state law (Washington Administrative Code [WAC] 246-101-101 and WAC 246-101-301). Healthcare providers and health care facilities, such as hospitals, must report this status to local health jurisdictions within three working days.

**Why Report?**

Identifying and reporting HBsAg-positive pregnant women during each pregnancy helps prevent the spread of hepatitis B virus to their babies. These babies have a very high risk of getting the infection and developing serious long-term medical conditions unless they get proper post-exposure prevention.

Local public health jurisdiction staff work with health care providers to make sure that:

- Mothers get counseled about preventing the spread of HBV to their babies and their household contacts.
- Mothers get screened and, if appropriate, referred to a specialist during pregnancy (see page 2 of this infographic).
- Mother’s sexual partner(s) get referred to a specialist for follow-up.
- Babies get hepatitis B immune globulin (HBIG) and 3 doses of hepatitis B vaccine (birth, 1-2 months, 6 months).
- Babies get post-vaccination testing (HBsAg and anti-HBs) between 9 and 12 months of age (at least 1 to 2 months after the third dose of hepatitis B vaccine) to check for infection and immune status.

**When to Report**

A report should be made at any time during each pregnancy in which the pregnant woman tests HBsAg positive. It is the prenatal care provider's responsibility to make sure the delivery hospital knows of an HBsAg-positive mother prior to the birth so the baby gets proper treatment.

**Reporting Requirements**

Per WAC 246-101-101 and WAC 246-101-301, healthcare providers and health care facilities who request the HBsAg test during prenatal care or at time of delivery must report all HBsAg-positive pregnant women to the provider’s LHJ within three working days.

**Reporting Resources from DOH**

- How to report notifiable conditions
- Reporting posters
- Hepatitis B as a notifiable condition
- If you have other questions, contact the Department of Health at 360-236-3595.
Vaccine Specifics: Administering Hepatitis B Vaccine

**Route and Site**
Give hepatitis B vaccine intramuscularly into the deltoid muscle of adults and children and into the anterolateral thigh muscle of newborns and babies. **Do not** give hepatitis B vaccine intradermally or into the buttock.

You can give hepatitis B vaccine at the same time as other vaccines, but use separate injection sites.

**Dose and Schedule**
Babies born to HBsAg-positive mothers should get the following. You can use different brands of the single-antigen vaccine for the vaccine doses.

<table>
<thead>
<tr>
<th>Within 12 hours of birth</th>
<th>1-2 months old</th>
<th>6 months old</th>
</tr>
</thead>
</table>
| • 0.5 ml of hepatitis B immune globulin (HBIG)  
• Hepatitis B vaccine *dose 1* (Engerix-B 10mcg/0.5ml or Recombivax 5mcg/0.5ml)  
These can be given at the same time but at different injection sites. | • Hepatitis B vaccine *dose 2* (Engerix-B 10mcg/0.5ml or Recombivax 5mcg/0.5ml) | • Hepatitis B vaccine *dose 3* (Engerix-B 10mcg/0.5ml or Recombivax 5mcg/0.5ml) |

**Vaccination of Premature Babies**
- Premature babies born to HBsAg-positive mothers or mothers with unknown status must get HBIG AND hepatitis B vaccine less than 12 hours after birth. If these babies weigh less than 2,000 grams at birth, do not count the first dose of hepatitis B vaccine as one of the doses in the series. The baby should get three additional doses of hepatitis B vaccine, starting when medically stable and at least 1 month of age. (MMWR, 2018). This will be a total of 4 doses.

- Premature babies born to HBsAg-negative mothers, regardless of birth weight, should get vaccinated at the same chronological age and with the same schedule and precautions as full-term babies. Use the full recommended dose of each vaccine, because divided or reduced doses cannot count as valid. Studies demonstrate that decreased seroconversion rates might occur among certain premature babies with low birth weight (less than 2,000 grams) after getting hepatitis B vaccine at birth. However, by chronological age 1 month, all premature babies regardless of initial birth weight or gestational age can respond as adequately as older and larger babies.
Vaccine Specifics: Recommended Doses of Currently Licensed Monovalent Hepatitis B Vaccines

Recombivax and Engerix-B vaccines both have three doses in their series. Engerix-B also is licensed for a four-dose series given at 0, 1-2, and 6 months. Dialysis patients should get Engerix-B at 0, 1, 2, and 6 months.

- Engerix B package insert, December 2015

<sup>7</sup> Infants born to HBsAg-positive mothers should also receive hepatitis B immune globulin (HBIG) 0.5 mL intramuscularly at a site different from that used for the hepatitis B vaccine.

<sup>8</sup> Change in dose, licensed in 1998. Infants born to HBsAg-negative mothers now receive the same dose as infants born to HBsAg-positive mothers. “If the suggested formulation is not available, the appropriate dosage can be achieved from another formulation provided that the total volume of vaccine administered does not exceed 1 mL.”

<sup>9</sup> Change in adolescent dose, licensed in 1995.
Vaccine Specifics: Administering HBIG

Route and Site
For newborns and babies: Give HBIG intramuscularly into the anterolateral thigh muscle.

Dose and Schedule
Newborns and babies should get 0.5 ml of HBIG within 12 hours of birth. They should also get dose 1 of hepatitis B vaccine at the same time at a separate injection site.

For other exposed persons, the dose of HBIG is 0.06 mL per kilogram of body weight. To calculate the dose:
- Convert body weight to kilograms (kg)
- Multiply the number of kilograms by 0.06 mL

For example, if the person weighs 110 pounds, the number of kilograms = 110 lbs ÷ 2.2 (number of pounds per kilogram) = 50.0 kg. The correct dose of HBIG then would be 50.0 kg x 0.06 (the amount per kg), giving a dose of 3.0 mL.

HBIG Dosage at a Glance
Use the following table to identify dosage based on weight.

<td>Refrigerate immediately upon arrival. Store at 2°-8°C (35°-46°F). <strong>Do not freeze.</strong></td>
</tr>
<tr>
<td>Shelf Life/Expiration:</td>
<td>Hepatitis B Vaccine - up to 3 years. Check date on container or vial. HBIG - up to 12 months. Check date on container or vial.</td>
</tr>
<tr>
<td>Instructions for Reconstitution or Use:</td>
<td>Inspect visually for particulate matter or discoloration. Shake vial or fill syringe well before use.</td>
</tr>
<tr>
<td>Shelf Life after Reconstituting or Opening:</td>
<td>Check expiration date on vial, or manufacturer-filled syringe. Give the vaccine shortly after withdrawal. If pre-filled syringe, administer after the needle is attached to the syringe.</td>
</tr>
<tr>
<td>Special Instructions:</td>
<td>Rotate stock so that you use the material with the earliest expiration date first.</td>
</tr>
</tbody>
</table>

**Best Practices for Storing and Handling All Vaccines**

- Have policies and procedures in place to rotate stock and check expiration date of vaccine weekly. Use vaccine with earliest expiration date so none become outdated.
- Do not use outdated vaccine.
- Never store vaccine in refrigerator door.
- When transporting vaccine, always use an insulated container with ice packs.
- [Vaccine storage and handling information from the Department of Health](#)
- [Vaccine storage and handling recommendations and guidelines from the CDC](#)
Vaccine Specifics: Ages and Intervals

* Source: [Epidemiology and Prevention of Vaccine-Preventable Diseases, CDC](#)

** Combination vaccines with a hepatitis B component are available (Comvax, Pediarix, and Twinrix). These vaccines should not be administered to infants younger than 6 weeks because other components in the vaccines are not suitable for this age group (i.e., Hib, DTaP, HepA, and IPV).

*** Hepatitis B-dose 3 should be administered at least 8 weeks after dose 2 and at least 16 weeks after dose 1.

---

**In WA: Did you know?**

In WA State, about 70% of birthing hospitals list correct doses of HBIG; about 84% list correct hepB vaccine doses.
