NOTE/ACKNOWLEDGEMENTS: This work was funded by an Environmental Protection Agency Multipurpose Grant (MPG). The Washington State Department of Health Site Assessment and Toxicology section thanks the DOH Shellfish Program, the Washington Department of Fish and Wildlife, the Washington Department of Natural Resources, The Swinomish Tribe, and Whatcom County Health and Community Services for providing sampling support and expertise to this project. We specifically thank Jerry Borchert for his contributions in coordinating efforts between the Shellfish and Toxicology sections.

Executive Summary

Per- and polyfluoroalkyl substances (PFAS) have been observed in freshwater finfish throughout Washington state. In some places perfluorooctane sulfonate (PFOS) concentrations in fish tissue at levels of concern to human health have resulted in fish consumption advisories. However, little is known about the incidence of PFAS in Puget Sound shellfish and crab.

This investigation measured PFAS concentrations in shellfish and crab species from select locations in Puget Sound to generate baseline data that may inform future fish consumption guidelines and sampling decisions. The results are compared to the current PFOS fish consumption advisory for lakes Meridian, Sammamish, and Washington and the FDAs PFAS in seafood analytical results.

All species and locations except for varnish clams at Squalicum creek and Dungeness crab in Penn Cove were below the MDLs for all PFAS analyzed. Therefore, DOH concludes that the PFAS exposure risk due to shellfish and Dungeness crab consumption from the Puget Sound to be low. One could consume 23 eight-ounce meals of varnish clams from the mouth of Squalicum creek per month before exposure would exceed DOH recommendations for dietary intake. Dungeness crab from Penn Cove had quantifiable concentrations of perfluorooctane sulfonamide (PFOSA), however, there are no human health protective values for PFOSA and therefore it is not possible to place these results within a human health context.

DOH encourages all Washingtonians to eat at least eight to twelve ounces of fish per week in accordance with The Dietary Guidelines for Americans (2020). People may eat more than this amount of fish weekly; however frequent consumers should consider taking steps to reduce exposure to contaminants in the fish that they eat. Some general guidance is as follows:

- Eat a variety of fish that are low in contaminants according to guidance provided by DOH (<http://www.doh.wa.gov/fish/>) and local health agencies.
- If consuming self-caught fish: consume younger, smaller fish (within legal limits). These fish typically contain lower levels of accumulative contaminants than older, larger fish.
- When cleaning fish, remove the skin, fat, and internal organs before cooking; this will help to reduce the amount of some contaminants.
- Grill, bake, or broil fish so that fat drips off while cooking. (advice is for fat stored contaminants like PCBs)
- Young children and small adults should eat proportionally smaller meal sizes (Table 2).

Introduction

Per- and polyfluoroalkyl substances (PFAS) have emerged as a global environmental and public health challenge, with significant implications for ecosystem and human health (Ecology 2021). This anthropogenic chemical class contains members that have been shown to be both persistent and bioaccumulative in the environment (Ecology 2021). PFAS have been widely used in industrial and consumer products for decades due to their hydro and lipophobic properties: with uses ranging from oil and water-repellent coatings to aqueous film-forming foam (AFFF) (Ecology 2021). Their ubiquitous use now results in environmental impacts as these substances accumulate in ecological systems.

Recent monitoring efforts in Washington State have detected PFAS across various environmental matrices, including surface waters, groundwater, wastewater treatment plant (WWTP) effluent, and both freshwater and marine environments (Ecology 2017 and 2021). Freshwater finfish have been observed with perfluorooctane sulfonate (PFOS) concentrations at levels of concern to human health and fish consumption advisories have been issued for several waterbodies (Ecology 2022, DOH 2022). Puget Sound monitoring data has shown low but detectable PFAS concentrations in select marine species. In 2023 DOH published a report on the evaluation of PFAS in commercial fish tissue to understand human health risk of consuming the top ten most purchased fish from grocery stores, however, that study did not include any crab or shellfish species (DOH 2023a).

Human health concerns for PFAS are substantiated by adverse effects observed in laboratory animal studies and epidemiological evidence. The most recent assessments by the Environmental Protection Agency (EPA) and the Agency for Toxic Substances and Disease Registry (ATSDR) have highlighted multiple systemic health impacts across various biological systems (EPA 2024, ATSDR 2021). Experimental animal studies have shown reproductive, liver, immune, testicular, and thyroid toxicity and endocrine disruption (DOH 2021). Epidemiological research has also identified human health associations of reduced fetal growth, reduced immune response to vaccines, higher serum cholesterol and liver enzymes, and increased incidence of kidney and testicular cancer (DOH 2021). Although PFOS and some other PFAS have been removed from commerce in the United States, others remain, and the persistent nature of these compounds continues to present ongoing environmental and public health challenges (Ecology 2021).

Data on crab and shellfish in the Puget Sound are limited. Caged mussels deployed seasonally have returned few detectable PFAS concentrations. Recently, the Food and Drug Administration (FDA) identified canned shellfish and crab, primarily from China, to be high in certain PFAS indicating the potential for PFAS to bioaccumulate within crab and shellfish species (FDA 2022). Due to the limitations in data availability and the evidence for accumulation within species more information is needed to evaluate human health risk and provide guidance. Further the Washington State Department of Health is tasked with regulating shellfish both recreationally and commercially. Therefore, understanding PFAS contamination incidence in the Puget Sound will be helpful to keeping people safe when recreationally consuming shellfish and provide the industry with some baseline data.

This investigation measured PFAS concentrations in shellfish and crab species throughout Puget Sound

using EPA method 1633. A targeted sampling approach was employed so the investigation could generate baseline data that may inform future fish consumption guidelines and sampling decisions. The results allow the DOH Shellfish staff and other partners to understand what current PFAS concentrations in shellfish may be throughout the Puget Sound and help frame what level of follow up sampling may be necessary.

Methods

Sampling sites were selected based on locations with known contamination sources, areas with suspected contamination, and/or areas where people may recreationally harvest shellfish regardless of formal status (i.e. open or closed). Primary sampling locations were distributed throughout the Sound (Figure 1).

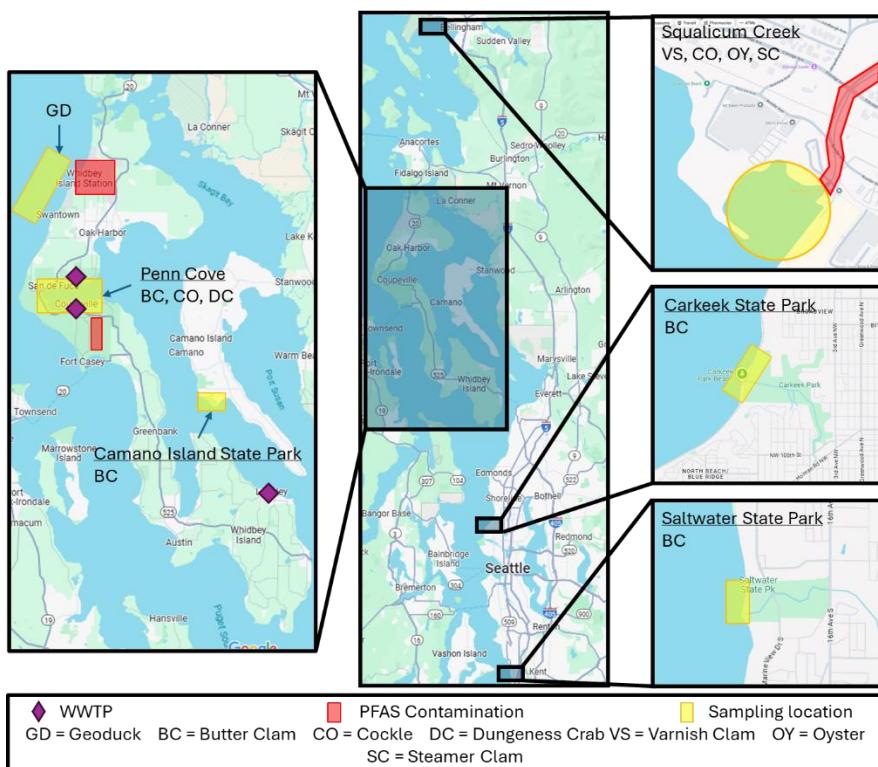

Figure 1. Sampling locations and species collected from each location.

From North to South: The mouth of Squalicum creek was selected due to recently identified PFAS surface water contamination within approximately one and a half miles of the sampling location. The Squalicum creek sampling location is also a secure access private property in an industrialized area of Bellingham WA. Squalicum creek surface water concentrations upstream were 360 ng/L total PFAS and foam concentrations were 31 µg/L total PFAS. Locations within Penn Cove on Whidbey Island were selected due to historical AFFF releases nearby, documented PFAS groundwater contamination, potential WWTP effluent impacts, and community concerns. Point Partridge, on the west side of Whidbey Island, is near established geoduck tracts and to the North is a formerly used outfall which

may have historically discharged water contaminated with PFAS. Camano Island State Park was included as a relatively remote site to provide comparative data from a less developed area. To assess the impact of urban development, sampling sites were established at Carkeek Park and Saltwater State Park, which serve as urban beach access and are known locations where recreational shellfish harvest occurs despite closure due to pollution.

Species collected are commonly harvested recreationally and were of convenience at each site: butter clam, manila and littleneck (steamer) clam, varnish clam, cockles, pacific oyster, Dungeness crab, and geoduck. All specimens collected were of legal harvest size to ensure relevance to recreational harvesting practices. During field collection, samples were collected whole in shell, separated by species, and stored in plastic bags on ice during transit to the DOH prep lab. Upon arrival at the DOH prep lab samples were stored at -20°C until shucking.

To account for natural variability and minimize sampling costs while maximizing information, composite samples were used. Composite samples were prepared by minimally thawing shellfish, separating the tissue from the shell, and placing the tissue into a plastic bag. For geoduck, the meat was subsampled using a disposable stainless-steel blade at the request of the analytical lab and was separated from the gut ball, the gut ball and meat were composited separately. Similarly, for Dungeness crab the meat and hepatopancreas were composited separately. When encountered, sediment inside the shells of clams and oysters was physically removed by hand to the extent possible to avoid potential confounding of results due to sediment.

At least three composite samples were prepared for each species at each sampling location except for butter clams from Camano Island State Park, geoduck from Point Partridge, and Dungeness crab from Penn Cove where sampling was limited. The number of individual specimens required for each composite sample varied by species to ensure adequate tissue mass for analysis. Pacific oyster, cockles and butter clam composites contained four to eight individuals, steamer and varnish clam composites required 20-30 individuals. Geoduck composites included two individuals except for one location where only a single individual was collected and the Dungeness crab composite contained three individuals. Composite samples were labeled, double bagged, and shipped frozen on ice to Enthalpy Analytical, LLC (Enthalpy) per their instructions for homogenization and analysis.

Homogenization was performed by Enthalpy according to their standard operating procedures. Analysis was conducted by Enthalpy using EPA method 1633. All samples were processed and analyzed using established laboratory procedures and quality assurance objectives. Each analytical batch included ongoing performance and recovery samples, matrix spike samples with duplicates (MS/MSD), and method blanks. Matrix spike recovery targets ranged from 40-150%, surrogate standard recoveries ranged from 20-150%, and the reporting limit (RL) for most compounds ranged from approximately 0.50 to 2.00 ng/g, with some compounds requiring higher quantitation limits between 5.00 to 15.00 ng/g. Comprehensive details for the entire analysis are available in Appendix A.

Detailed methods for the derivation of fish tissue screening levels are discussed in DOHs Fish Advisory Evaluation: PFOS in Fish from Lakes Meridian, Sammamish, and Washington (DOH 2022) and DOHs

Fish Tissue Data Evaluation Procedure (DOH 2023b). Briefly, DOH derived the non-cancer health protective screening value for PFOS in fish tissue as follows:

$$\text{Screening Level (SL}_{nc}\text{)} = \frac{\text{RfD} \times \text{BW} \times \text{UCF}}{\text{CR}} \times \text{RSC}$$

Using a PFOS reference dose (RfD) of 3×10^{-6} mg/kg-day, from the current State Action Level (2021) in drinking water based on Dong et. al. 2011; consumption rates of 23 meals per month, one meal is defined as one 8-oz serving (6-oz. cooked), a bodyweight of 70 kg; and a relative source contribution (RSC) of 0.5. Yielding a PFOS fish tissue screening level of 0.6 µg/kg.

Results

Analysis of shellfish tissue samples across all locations revealed limited PFAS detection (Table 1 and Appendix A), with positive results confined to two areas: Squalicum Creek and Penn Cove. Of the 40 PFAS compounds analyzed, only two compounds - PFOS and perfluorooctane sulfonamide (PFOSA) - were quantified above the RL.

At Squalicum Creek varnish clams showed consistent low-level PFOS contamination across the five composite samples analyzed with concentrations ranging from no detection(< 0.361 µg/kg) to 0.692 µg/kg wet weight. The average concentration was 0.59 µg/kg wet weight. DOH guidance allows for inclusion of non-detect data depending on the assessment. In this case, as PFOS was observed in four of the five varnish clam samples the detection limit (0.361 µg/kg) was substituted for the non-detect sample in determining mean PFOS concentration rather than omitting the sample. None of the other species analyzed (i.e. cockles, oysters, and steamer clams) had PFAS concentrations above the method detection limit (MDL) at Squalicum creek. The varnish clams were harvested approximately 25 meters from the mouth of the creek whereas the other species were harvested deeper into the embayment 100 – 250 meters away. It is possible that this spatial relationship explains the concentrations in varnish clams rather than a species-specific mechanism, but further study is needed. At Penn Cove Dungeness crab meat contained 0.83 µg/kg wet weight PFOSA and there were no detections in the hepatopancreas. This was the only composite sample of crab in the study and should be considered as exploratory. All other sampling locations and species combinations showed no detectable concentrations of any PFAS compounds above the MDLs.

The concentrations observed in this study can be contextualized against the current Washington state fish consumption advisory for PFOS and the FDA assessment of PFAS in commercial seafood (FDA 2022). The current Washington state fish consumption advisory for PFOS covers only freshwater finfish in three urban lakes and PFOS concentrations in fish tissue from that evaluation ranged from 1.1 to 93.8 µg/kg. While not directly translatable it can be stated that it is likely shell fishing and crabbing from legally open, non-urban locations provides a safer choice for those consuming local fish compared to advisory areas. The FDA assessment provides a more direct comparison and indicated that canned clams from China contained PFOS concentrations from 0.19 to 1.2 µg/kg and PFOA concentrations from 2.9 to 20.1 µg/kg. Crab meat from Indonesia and Mexico contained PFOS concentrations from below detection to 0.34 µg/kg and PFOA concentrations from 0.09 to 0.51 µg/kg. The FDA's study did not evaluate PFOSA. However, of the PFAS in common between the FDA study and this study; the PFAS concentrations in clams and crab from the FDA study were higher than the levels detected in our Puget Sound samples. Notably PFOA concentrations which were not detected in Puget Sound samples but were the highest PFAS concentration observed in the FDA sampling. At this point it cannot be determined if this is due to processing methods (e.g. canning or bagging for retail) or geographic differences.

Conclusion

All species and locations except for varnish clams at Squalicum creek and Dungeness crab in Penn Cove were below the MDLs for all PFAS analyzed, therefore, DOH concludes that the PFAS exposure risk due to shellfish and Dungeness crab consumption from the Puget Sound to be low. The detected concentrations of PFOS in varnish clams from Squalicum creek are approximately equivalent to the current PFOS screening level (0.6 µg/kg) and below the level at which a fish consumption advisory would be issued (1.8 µg/kg). Relating these findings to 8-ounce meals, one could consume 23 meals of varnish clams from the mouth of Squalicum creek per month before exposure would exceed DOH recommendations for dietary intake.

Currently there are no human health protective values for PFOSA and therefore it is not possible to place the results of Dungeness crab withing a human health context. However, when compared to PFOS, the concentration in Dungeness crab is between the screening and fish consumption advisory levels and as such should be further evaluated. DOH would recommend that in the next Dungeness crab tissue evaluation in the Puget Sound that PFAS are included in the analysis.

DOH encourages all Washingtonians to eat at least eight to twelve ounces of fish per week in accordance with The Dietary Guidelines for Americans (2020). People may eat more than this amount of fish weekly; however frequent consumers should consider taking steps to reduce exposure to contaminants in the fish that they eat. Some general guidance is as follows:

- Eat a variety of fish that are low in contaminants according to guidance provided by DOH (<http://www.doh.wa.gov/fish/>) and local health agencies.
- If consuming self-caught fish: consume younger, smaller fish (within legal limits). These fish

typically contain lower levels of accumulative contaminants than older, larger fish.

- When cleaning fish, remove the skin, fat, and internal organs before cooking; this will help to reduce the amount of some contaminants.
- Grill, bake, or broil fish so that fat drips off while cooking. (advice is for fat stored contaminants like PCBs)
- Young children and small adults should eat proportionally smaller meal sizes (Table 2).

September 17, 2024

Enthalpy Analytical - El Dorado Hills

Work Order No. 2408100

Mr Emerson Christie
Washington State Department of Health
111 Israel Road S.E.
Tumwater, WA 98501

Dear Mr Christie,

Enclosed are the results for the sample set received at Enthalpy Analytical - EDH on August 15, 2024 under your Project Name 'SHELLFISH PFAS'.

Enthalpy Analytical - EDH is committed to serving you effectively. If you require additional information, please contact me at 916-673-1520 or by email at emilyuebelhoer@enthalpy.com.

Thank you for choosing Enthalpy Analytical - EDH as part of your analytical support team.

Sincerely,

A handwritten signature in black ink that reads "Emily Uebelhoer".

Emily Uebelhoer
Project Manager

Enthalpy Analytical - EDH certifies that the report herein meets all the requirements set forth by NELAP for those applicable test methods. Results relate only to the samples as received by the laboratory. This report should not be reproduced except in full without the written approval of Enthalpy Analytical - EDH.

Enthalpy Analytical - EDH Work Order No. 2408100
Case Narrative

Sample Condition on Receipt:

Nineteen tissue samples were received and stored securely in accordance with Enthalpy Analytical - EDH standard operating procedures and EPA methodology. The samples were received outside of hold time, in good condition and within the method temperature requirements.

Analytical Notes:

EPA Method 1633 (Tissue)

The samples were extracted and analyzed for a selected list of PFAS using EPA Method 1633. The results for PFHxS, PFOA, PFOSA, PFOS, PFNA, MeFOSAA, EtFOSAA, MeFOSA, MeFOSE, EtFOSA, EtFOSE include both linear and branched isomers. Results for all other analytes include the linear isomers only.

Holding Times

The samples were extracted outside of hold time. Samples were analyzed within the hold times.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank, Ongoing Precision and Recovery (OPR) sample, and Low-Level OPR sample were extracted and analyzed with the preparation batch. No analytes were detected in the Method Blank above the Reporting Limit. The OPR recoveries were within the method acceptance criteria.

As requested, an MS/MSD was performed on sample SC-OY-02. The MS/MSD recoveries and RPDs were within acceptance criteria, except for PFDoS which is flagged with a "Q" qualifier.

The labeled standard recoveries outside the acceptance criteria are flagged with an "Q" qualifier. The responses of the internal standards with low recoveries were greater than 10:1 signal-to-noise, which is the limit generally considered acceptable for accurate quantitation by isotope dilution analysis.

MDL - Method Detection Limit

RL - Reporting limit

Results reported to RL.

DATA QUALIFIERS & ABBREVIATIONS

For EPA 1633

| | |
|---------|--|
| B | This compound was also detected in the method blank |
| Conc. | Concentration |
| CRS | Cleanup Recovery Standard |
| D | Dilution |
| DL | Detection Limit |
| E | The associated compound concentration exceeded the calibration range of the instrument |
| I | Ion transition ratio is outside of the acceptance criteria. |
| IS | Internal Standard |
| J | The amount detected is below the Reporting Limit/LOQ |
| LOD | Limit of Detection |
| LOQ | Limit of Quantitation |
| M | Estimated Maximum Possible Concentration (CA Region 2 projects only) |
| MDL | Method Detection Limit |
| NA | Not applicable |
| ND | Not Detected |
| OPR | Ongoing Precision and Recovery sample |
| P | The reported concentration may include contribution from chlorinated diphenyl ether(s). |
| Q | Recovery and/or RPD was outside laboratory acceptance limits |
| RL | Reporting Limit |
| RL | For 537.1, the reported RLs are the MRLs. |
| TEQ | Toxic Equivalency, sum of the toxic equivalency factors (TEF) multiplied by the sample concentrations. |
| TEQMax | TEQ calculation that uses the detection limit as the concentration for non-detects |
| TEQMin | TEQ calculation that uses zero as the concentration for non-detects |
| TEQRisk | TEQ calculation that uses $\frac{1}{2}$ the detection limit as the concentration for non-detects |
| U | Not Detected (specific projects only) |
| * | See Cover Letter |

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

**Enthalpy Analytical - El Dorado Hills
Work Order No. 2409185**

Mr Emerson Christie
Washington State Department of Health
111 Israel Road S.E.
Tumwater, WA 98501

Dear Mr Christie,

Enclosed are the results for the sample set received at Enthalpy Analytical - EDH on September 24, 2024 under your Project Name 'SHELLFISH PFAS'.

Enthalpy Analytical - EDH is committed to serving you effectively. If you require additional information, please contact me at 916-673-1520 or by email at emilyuebelhoer@enthalpy.com.

Thank you for choosing Enthalpy Analytical - EDH as part of your analytical support team.

Sincerely,

A handwritten signature in black ink that reads 'Byron Clack'.

Byron Clack For Emily Uebelhoer
Project Manager

Enthalpy Analytical -EDH certifies that the report herein meets all the requirements set forth by NELAP for those applicable test methods. Results relate only to the samples as received by the laboratory. This report should not be reproduced except in full without the written approval of Enthalpy Analytical -EDH.

Enthalpy Analytical - EDH Work Order No. 2409185**Case Narrative****Sample Condition on Receipt:**

Twenty tissue samples were received and stored securely in accordance with Enthalpy Analytical - EDH standard operating procedures and EPA methodology. The samples were received in good condition and within the method temperature requirements. Sample ID discrepancies were noted for the samples between the container labels and the Chain-of-Custody (CoC). The sample IDs have been reported as listed on the CoC. No collection times were noted on the Chain-of-Custody (CoC) for all samples; the collection times have been reported as 00:00.

Analytical Notes:**EPA Method 1633 (Tissue)**

The samples were extracted and analyzed for a selected list of PFAS using EPA Method 1633. The results for PFHxS, PFOA, PFOSA, PFOS, PFNA, MeFOSAA, EtFOSAA, MeFOSA, MeFOSE, EtFOSA, EtFOSE include both linear and branched isomers. Results for all other analytes include the linear isomers only.

Holding Times

The samples were extracted outside of hold time. Samples were analyzed within the hold times.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank, Ongoing Precision and Recovery (OPR) sample, and Low-Level OPR sample were extracted and analyzed with each preparation batch. No analytes were detected in the Method Blank above the Reporting Limit. The OPR recoveries were within the method acceptance criteria.

As requested, an MS/MSD was performed on sample SSP-BC-03. The MS/MSD recoveries and RPDs were within acceptance criteria.

The ion transition ratios outside the acceptance criteria are flagged with an "I" qualifier.

The labeled standard recoveries outside the acceptance criteria are flagged with an "Q" qualifier. The responses of the internal standards with low recoveries were greater than 10:1 signal-to-noise, which is the limit generally considered acceptable for accurate quantitation by isotope dilution analysis.

MDL - Method Detection Limit

RL - Reporting limit

Results reported to RL.

DATA QUALIFIERS & ABBREVIATIONS

For EPA 1633

| | |
|---------|--|
| B | This compound was also detected in the method blank |
| Conc. | Concentration |
| CRS | Cleanup Recovery Standard |
| D | Dilution |
| DL | Detection Limit |
| E | The associated compound concentration exceeded the calibration range of the instrument |
| I | Ion transition ratio is outside of the acceptance criteria. |
| IS | Internal Standard |
| J | The amount detected is below the Reporting Limit/LOQ |
| LOD | Limit of Detection |
| LOQ | Limit of Quantitation |
| M | Estimated Maximum Possible Concentration (CA Region 2 projects only) |
| MDL | Method Detection Limit |
| NA | Not applicable |
| ND | Not Detected |
| OPR | Ongoing Precision and Recovery sample |
| P | The reported concentration may include contribution from chlorinated diphenyl ether(s). |
| Q | Recovery and/or RPD was outside laboratory acceptance limits |
| RL | Reporting Limit |
| RL | For 537.1, the reported RLs are the MRLs. |
| TEQ | Toxic Equivalency, sum of the toxic equivalency factors (TEF) multiplied by the sample concentrations. |
| TEQMax | TEQ calculation that uses the detection limit as the concentration for non-detects |
| TEQMin | TEQ calculation that uses zero as the concentration for non-detects |
| TEQRisk | TEQ calculation that uses $\frac{1}{2}$ the detection limit as the concentration for non-detects |
| U | Not Detected (specific projects only) |
| * | See Cover Letter |

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.

**Enthalpy Analytical - El Dorado Hills
Work Order No. 2409186**

Mr Emerson Christie
Washington State Department of Health
111 Israel Road S.E.
Tumwater, WA 98501

Dear Mr Christie,

Enclosed are the results for the sample set received at Enthalpy Analytical - EDH on September 24, 2024 under your Project Name 'SHELLFISH PFAS'.

Enthalpy Analytical - EDH is committed to serving you effectively. If you require additional information, please contact me at 916-673-1520 or by email at emilyuebelhoer@enthalpy.com.

Thank you for choosing Enthalpy Analytical - EDH as part of your analytical support team.

Sincerely,

A handwritten signature in black ink that reads "Emily Uebelhoer".

Emily Uebelhoer
Project Manager

Enthalpy Analytical -EDH certifies that the report herein meets all the requirements set forth by NELAP for those applicable test methods. Results relate only to the samples as received by the laboratory. This report should not be reproduced except in full without the written approval of Enthalpy Analytical -EDH.

Enthalpy Analytical - EDH Work Order No. 2409186
Case Narrative

Sample Condition on Receipt:

Eleven tissue samples were received and stored securely in accordance with Enthalpy Analytical - EDH standard operating procedures and EPA methodology. The samples were received in good condition and within the method temperature requirements. No collection time was noted on the Chain-of-Custody (CoC) for all samples; the collection time has been reported as 00:00.

Analytical Notes:

EPA Method 1633 (Tissue)

The samples were extracted and analyzed for a selected list of PFAS using EPA Method 1633. The results for PFHxS, PFOA, PFOSA, PFOS, PFNA, MeFOSAA, EtFOSAA, MeFOSA, MeFOSE, EtFOSA, EtFOSE include both linear and branched isomers. Results for all other analytes include the linear isomers only.

Holding Times

The samples were extracted outside hold time. Samples were analyzed within the hold times.

Quality Control

The Initial Calibration and Continuing Calibration Verifications met the method acceptance criteria.

A Method Blank, Ongoing Precision and Recovery (OPR) sample, and Low-Level OPR sample were extracted and analyzed with each preparation batch. No analytes were detected in the Method Blank above the Reporting Limit. The OPR recoveries were within the method acceptance criteria.

As requested, an MS/MSD was performed on sample "PCK-BC-02". The MS/MSD recoveries and RPDs were within acceptance criteria.

The labeled standard recoveries outside the acceptance criteria are flagged with an "Q" qualifier. The responses of the internal standards with low recoveries were greater than 10:1 signal-to-noise, which is the limit generally considered acceptable for accurate quantitation by isotope dilution analysis.

MDL - Method Detection Limit

RL - Reporting limit

Results reported to RL.

DATA QUALIFIERS & ABBREVIATIONS

For EPA 1633

| | |
|---------|--|
| B | This compound was also detected in the method blank |
| Conc. | Concentration |
| CRS | Cleanup Recovery Standard |
| D | Dilution |
| DL | Detection Limit |
| E | The associated compound concentration exceeded the calibration range of the instrument |
| I | Ion transition ratio is outside of the acceptance criteria. |
| IS | Internal Standard |
| J | The amount detected is below the Reporting Limit/LOQ |
| LOD | Limit of Detection |
| LOQ | Limit of Quantitation |
| M | Estimated Maximum Possible Concentration (CA Region 2 projects only) |
| MDL | Method Detection Limit |
| NA | Not applicable |
| ND | Not Detected |
| OPR | Ongoing Precision and Recovery sample |
| P | The reported concentration may include contribution from chlorinated diphenyl ether(s). |
| Q | Recovery and/or RPD was outside laboratory acceptance limits |
| RL | Reporting Limit |
| RL | For 537.1, the reported RLs are the MRLs. |
| TEQ | Toxic Equivalency, sum of the toxic equivalency factors (TEF) multiplied by the sample concentrations. |
| TEQMax | TEQ calculation that uses the detection limit as the concentration for non-detects |
| TEQMin | TEQ calculation that uses zero as the concentration for non-detects |
| TEQRisk | TEQ calculation that uses $\frac{1}{2}$ the detection limit as the concentration for non-detects |
| U | Not Detected (specific projects only) |
| * | See Cover Letter |

Unless otherwise noted, solid sample results are reported in dry weight. Tissue samples are reported in wet weight.
